1 How to read this document

The document follows the six stylized facts of the July-2026 note (v. 2026-07-29). Each section opens with the fact, reproduces its *original* exhibit on the current base, and then places under it every variant prepared for the working paper: (1a) the figures with the foreign-MNE bar split by the multinational’s home country; (1b) alternative product-sophistication measures for Figure 2, including the Fontagné–Guimbard–Orefice (2022) elasticities; (1c, 1d) two-way tables and heat maps of parent country $\times$ destination; (1e) headquarters versus affiliates and MNE counts; (1f) products at HS6 with descriptions; (2) the agriculture version and the four-sector comparison. Appendices hold the per-origin tables and the numbers behind the figures. Everything is generated by `stylized_facts/python/wp_*.py` in the project repository (github.com/jsvp97/IADB_Orbis_DNB_Customs_Final); the reader’s guide is `docs/WP_RESULTS_2026-09-07.md`.

Conventions (identical to the note). Matched = the firm was found in Orbis or D&B (`_merge_DNB_Orbis=3`); domestic MNE = parent in the exporting country; foreign MNE = matched minus domestic, so matched firms with no recorded parent count as foreign; nine origins (Ecuador excluded); value-weighted; pooled 2006–2022; navy = foreign, light gray = domestic. Wherever the foreign bar is split by home country, the five largest parent countries (by foreign-MNE export value in the scope) are shown and every other foreign MNE—including those with no recorded parent—is pooled into “Other foreign MNEs”. Scopes: all goods (\$2,394 bn), agriculture (HS 01–24, \$788 bn), mining & fuels (HS 25–27 and 71, \$810 bn), manufacturing (\$795 bn).

Same data as the note. The regressions that do not depend on the parent country reproduce the note to the last digit: Table 21 returns the note’s Table 1 coefficients and observation counts (e.g. 2.0685, 0.9414, 0.2391; $N = 1,008,185$), and Table 28 the note’s Table 2 within rounding. The base is therefore the same 5.45 M firm–destination–product–year rows. The one field that differs is the *parent country*: the current base carries a recorded parent for 92 % of foreign-MNE export value (script 02 and the AI review of unknown parents, merged in the 2026-04-21 build), whereas the note’s Figure 4 was drawn on a copy in which about half of that value had no recorded parent. Consequences, visible below: the parent ranking becomes USA > GBR > CAN > LIE > DEU > NLD (Table 6); Liechtenstein appears (foundations owning Argentine and Chilean exporters of copper ore, oil-cake and cereals—a conduit, to be treated like PAN/CHE/NLD); and the domestic-MNE share where the recovered parents are the origin country (COL 0.28 $\rightarrow$ 0.39, CHL 0.02 $\rightarrow$ 0.14 in Figure 1), so the “foreign $\gg$ domestic” statement of Fact 1 needs a qualification for Colombia.

One data limit. “Headquarters exporters” are not identifiable: every matched exporter has a global ultimate owner different from itself (0 of 5.45 M rows), because the match runs through ownership links. What is identifiable is the group’s presence *at the destination* through its headquarters (the affiliate ships to the parent’s country) or through another affiliate—Sections 6 and 7 use that.

2 Fact 1 — Multinational corporations account for a large share of export values across countries

2.1 Original exhibit

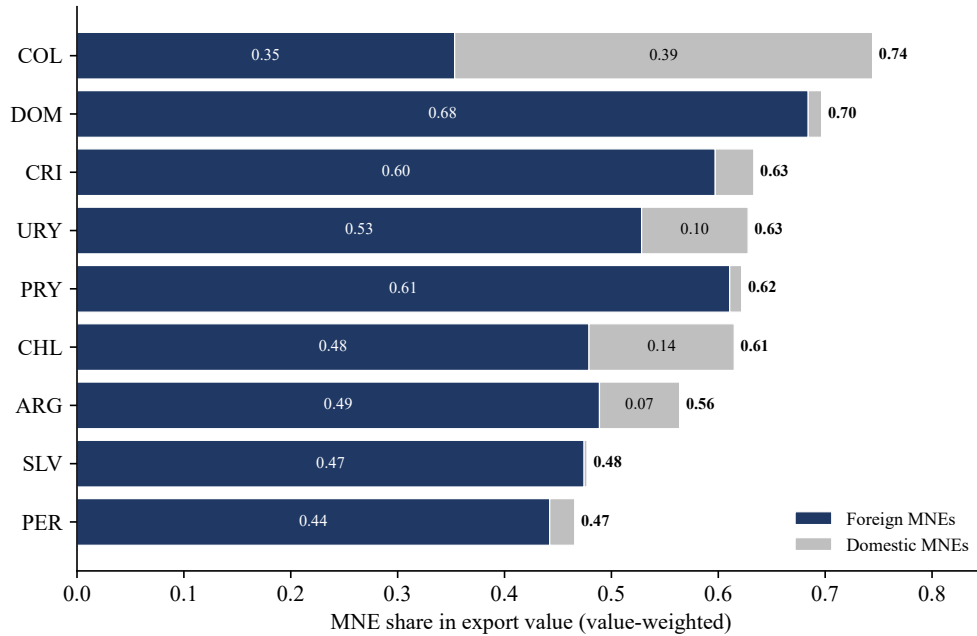

Figure 1: Figure 1 of the note, reproduced on the current base: MNE share of export value by origin, foreign vs domestic.

Note: Value-weighted; pooled 2006–2022; nine LAC origins. Bar length = total MNE share; numbers behind the bars in Table 62.

2.2 Variant: the foreign bar split by the multinational's home country (item 1a)

The five largest parents in all goods are the United States, the United Kingdom, Canada, Liechtenstein and Germany. US parents dominate the maquila and Central-American origins (CRI, PRY, SLV) and are minor in the Andean and Southern-Cone commodity exporters; British parents are the largest in Chile and Peru (copper), Canadian ones in the Dominican Republic (gold).

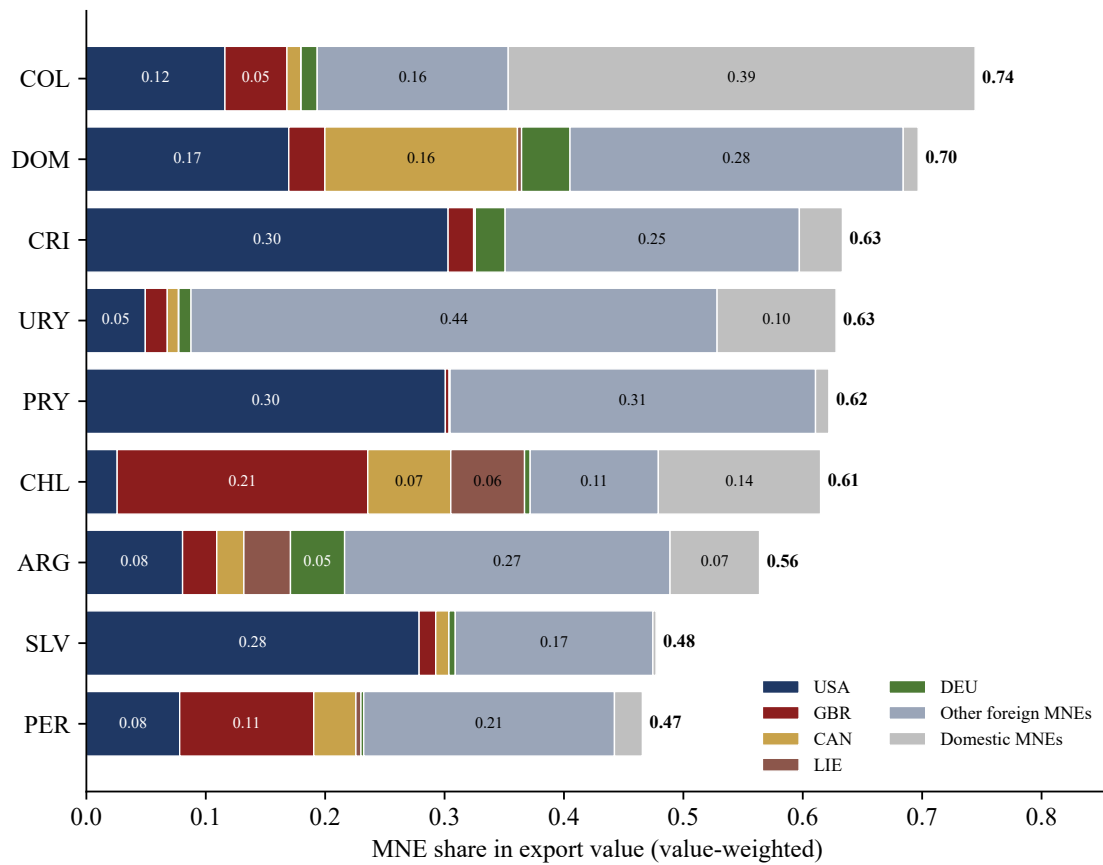

Figure 2: MNE share of export value by origin, foreign bar split by parent country (top 5, Other foreign, Domestic).

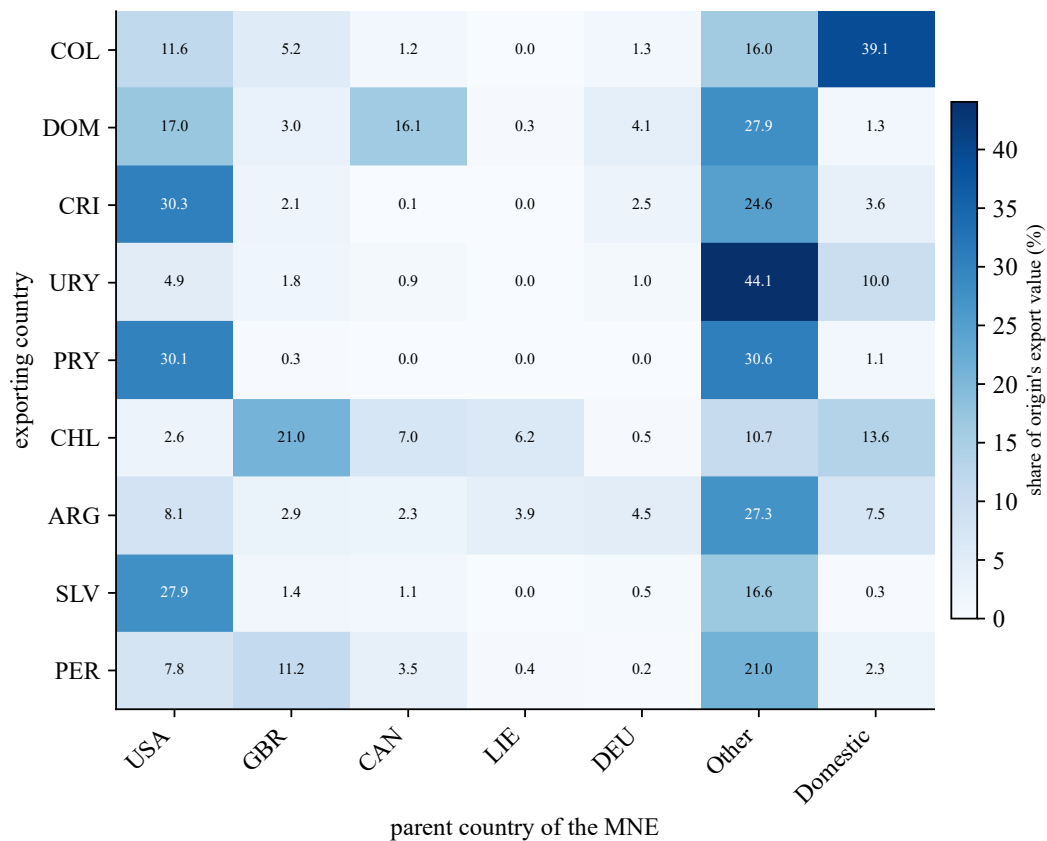

Figure 3: Companion heat map: share of each origin's export value by parent-country group (%).

2.3 Variant: by sector (item 2)

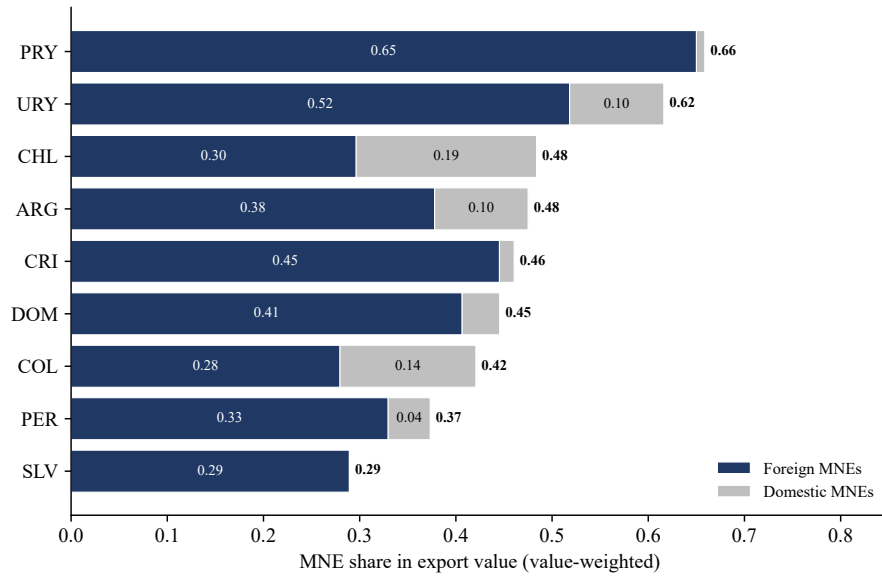

Figure 4: Agriculture (HS 01–24): Figure 1 reproduced for the sector.

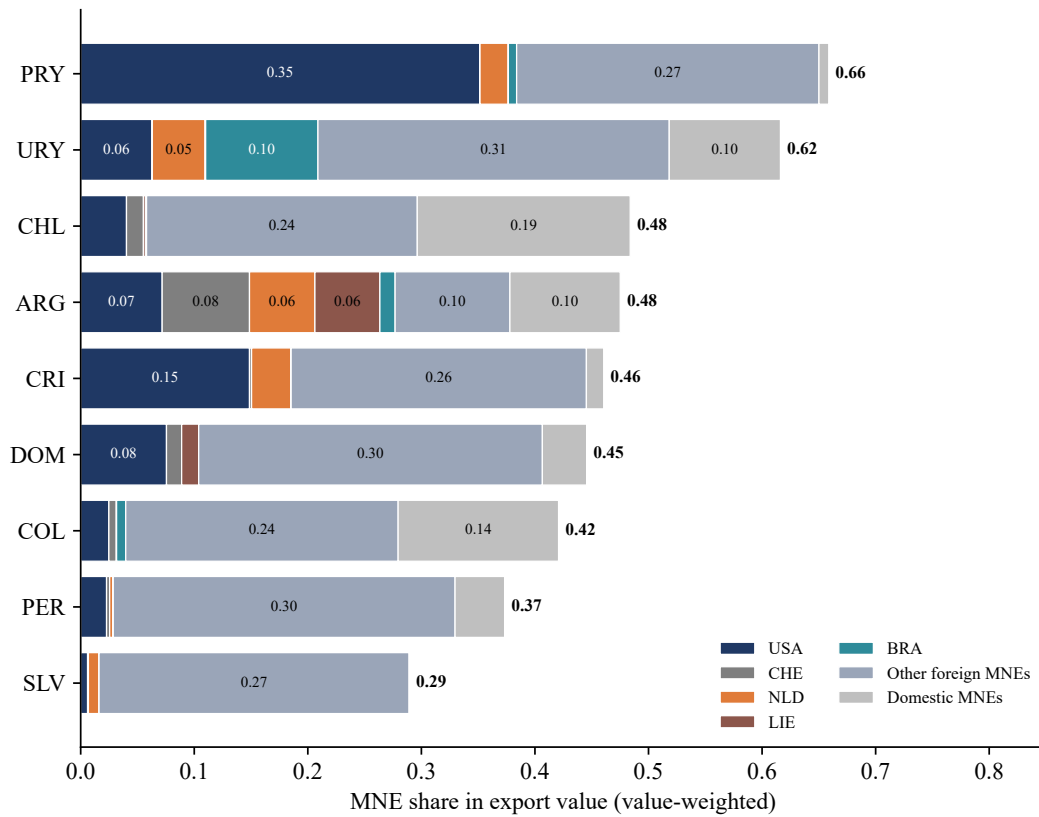

Figure 5: Agriculture (HS 01–24): foreign bar split by parent country.

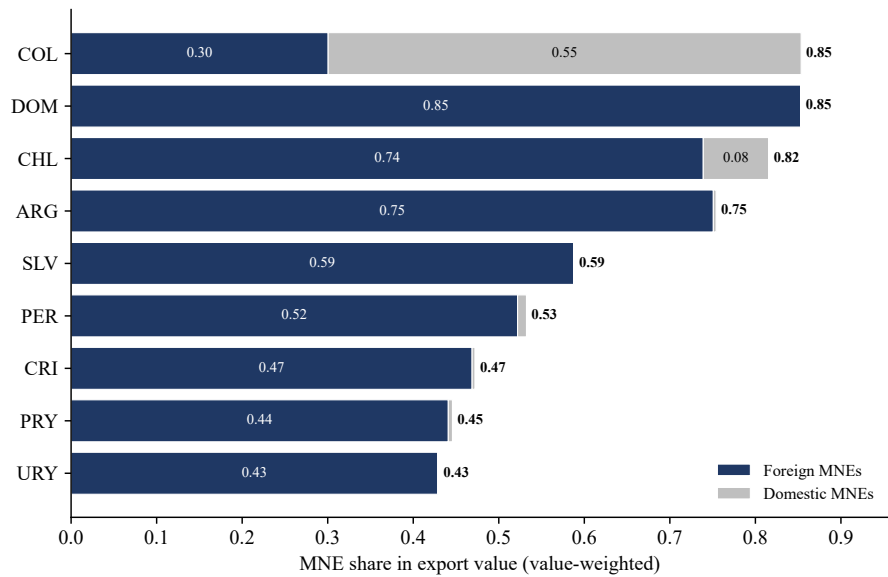

Figure 6: Mining & fuels (HS 25–27, 71): Figure 1 reproduced for the sector.

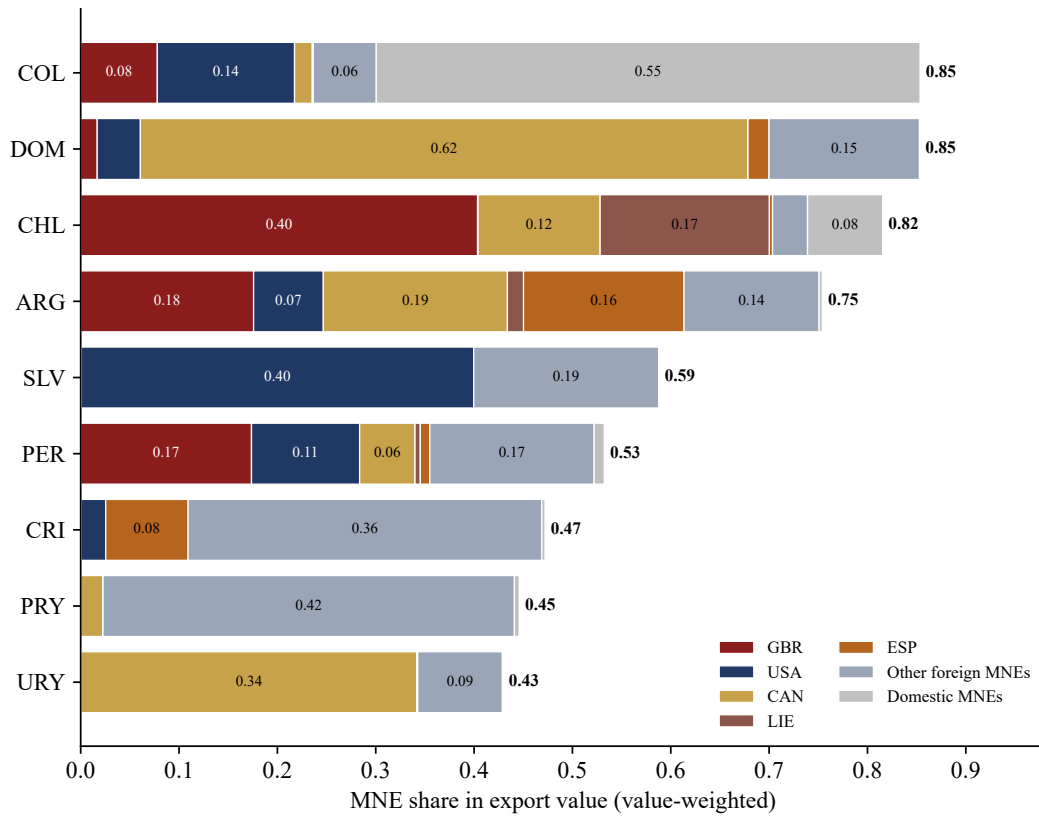

Figure 7: Mining & fuels (HS 25–27, 71): foreign bar split by parent country.

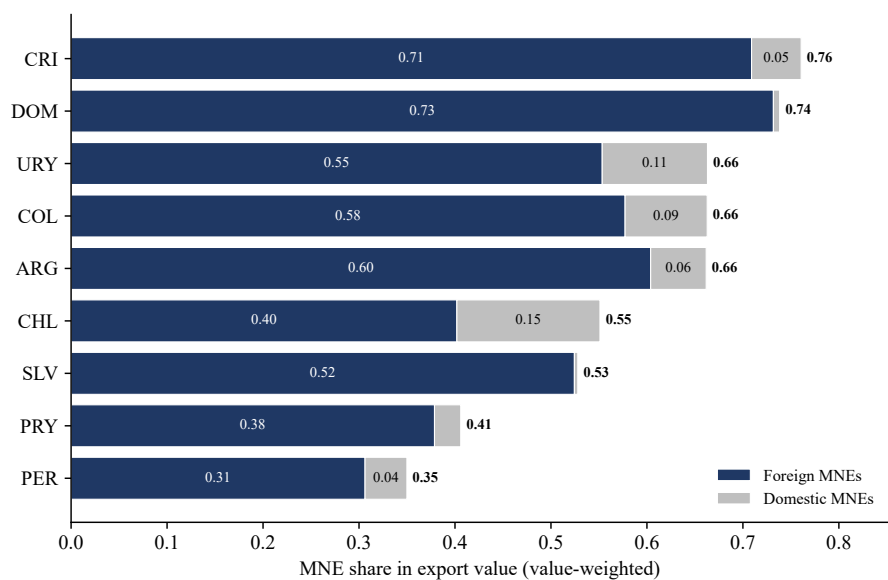

Figure 8: Manufacturing: Figure 1 reproduced for the sector.

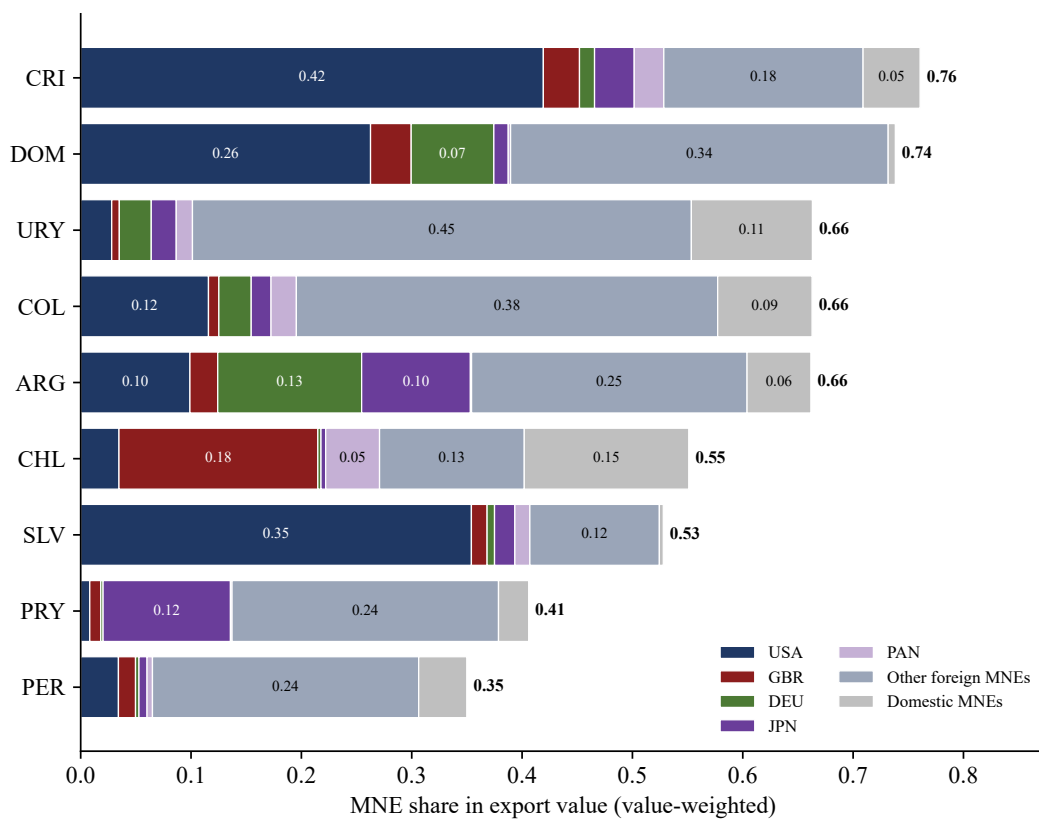

Figure 9: Manufacturing: foreign bar split by parent country.

3 Fact 2 — Foreign multinationals specialize in complex products, domestic ones in primary goods

3.1 Original exhibits

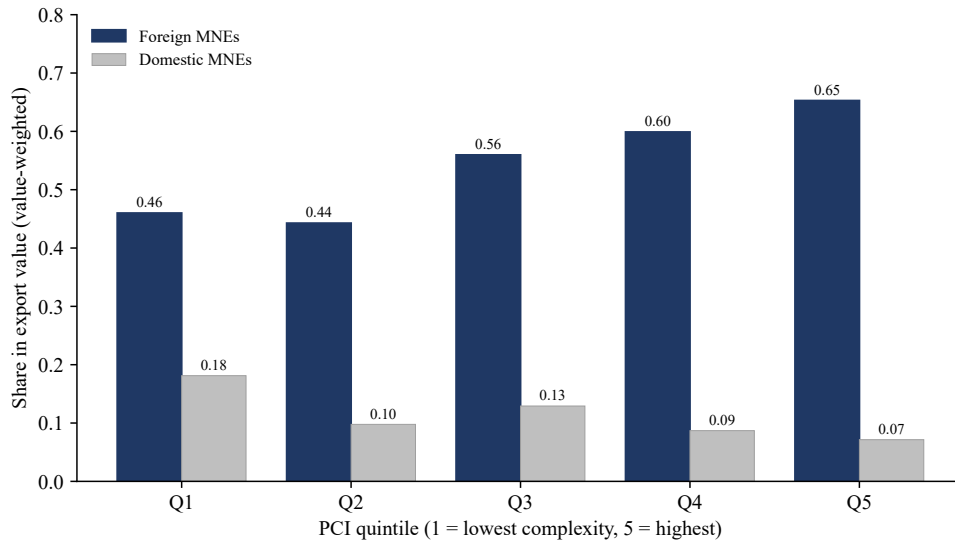

Figure 10: Figure 2 of the note, reproduced: MNE share of export value by Product Complexity Index quintile.

Note: Value-weighted at HS6; quintiles of the Hausmann–Hidalgo PCI over HS6 products (Q1 = least complex).

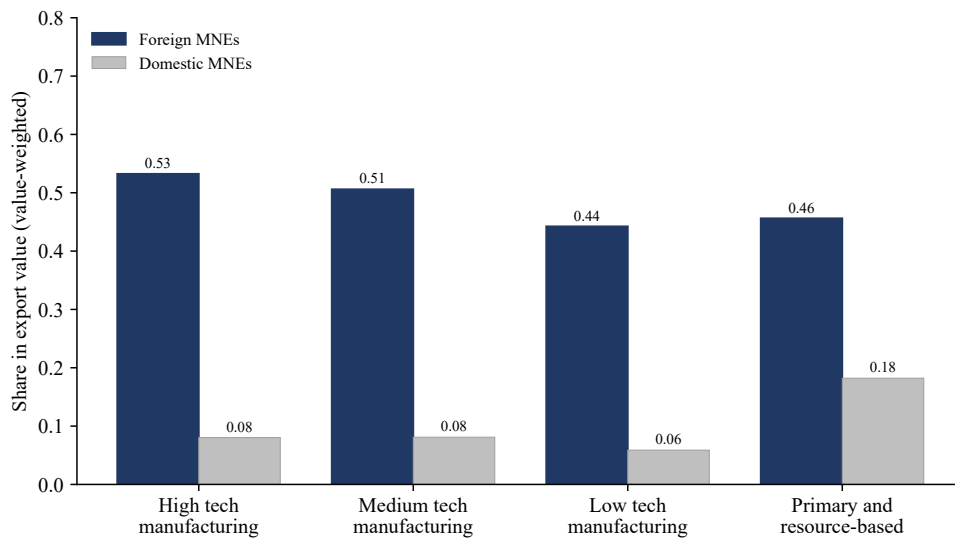

Figure 11: Figure 3 of the note, reproduced: MNE share of export value by Lall (2000) technology category.

3.2 Variant: split by the multinational's home country (item 1a)

The rising foreign share across complexity quintiles is carried by US, German and Japanese parents (vehicles and machinery in Q5); British and Canadian parents sit in the least complex quintile (ores and metals). Domestic MNEs fall from Q1 to Q5.

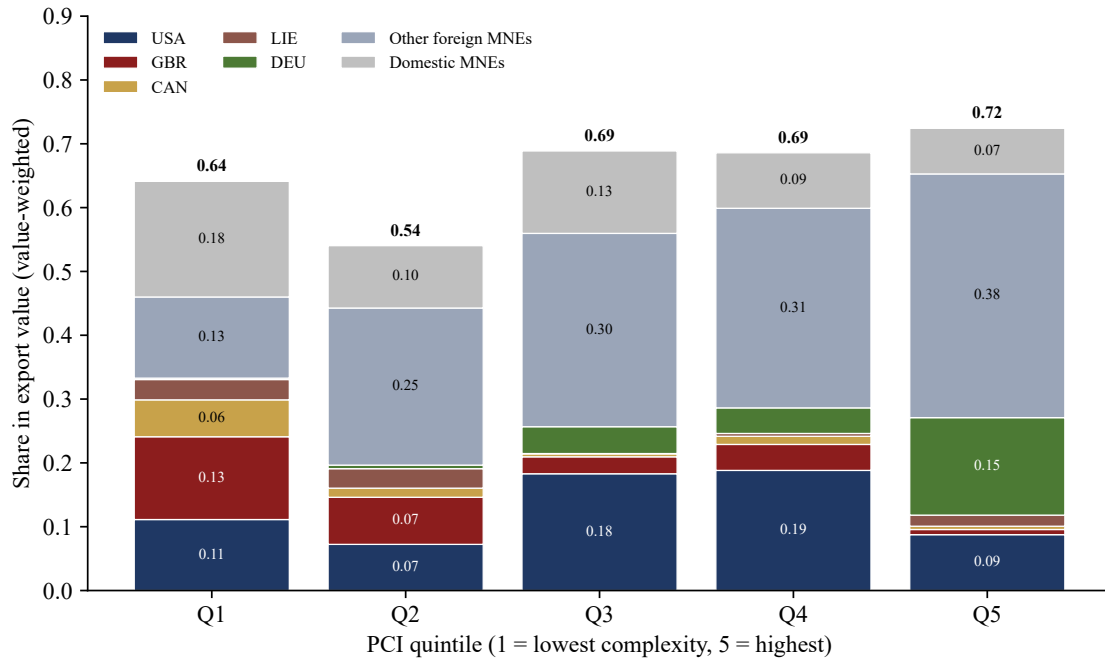

Figure 12: Figure 2 with the foreign bar split by parent country.

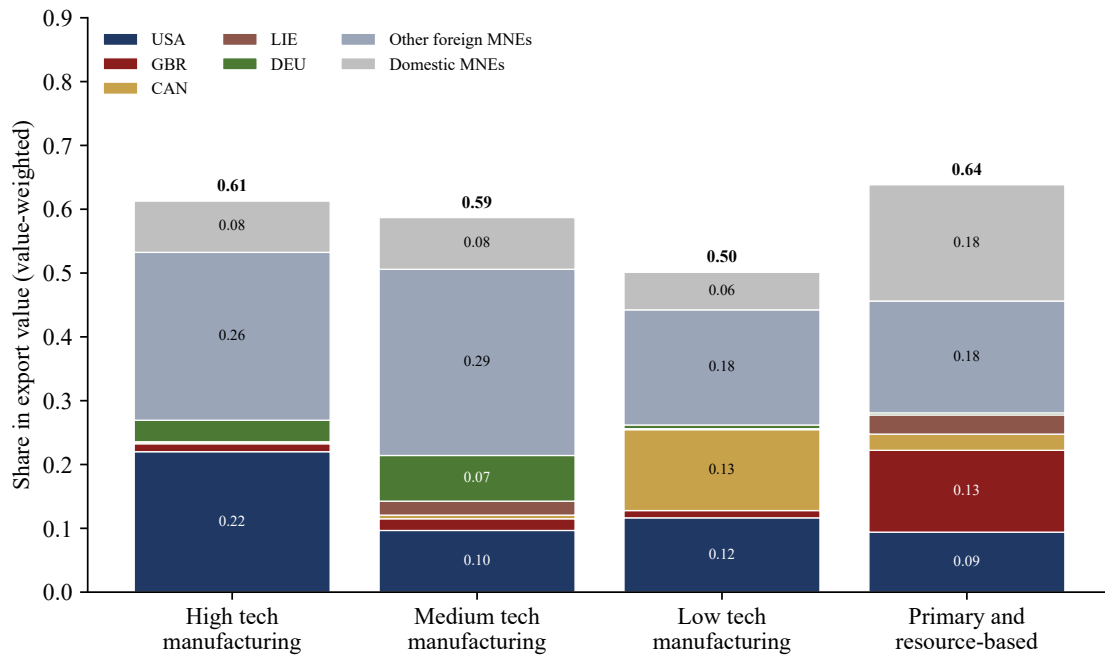

Figure 13: Figure 3 with the foreign bar split by parent country.

3.3 Variant: other measures of product sophistication; substitution elasticities (item 1b)

The hypothesis was that more substitutable products (a larger import-demand elasticity in absolute value) are less complex, so the foreign-MNE share should fall across elasticity quintiles as it rises across PCI quintiles. The Fontagné–Guimbarde–Orefice (2022) elasticities (CEPII ProTEE, HS6 rev. 2007; 90 % of HS6 lines, 78 % of export value) do not show this: there is no monotone gradient across $|\sigma|$ quintiles, the elasticity measures are essentially orthogonal to complexity (Table 2), and in the note’s Table A.4 ladder $|\sigma|$ enters *positive* for the foreign share conditional on PCI (Table 4). Only PCI and RHCI sort foreign presence monotonically.

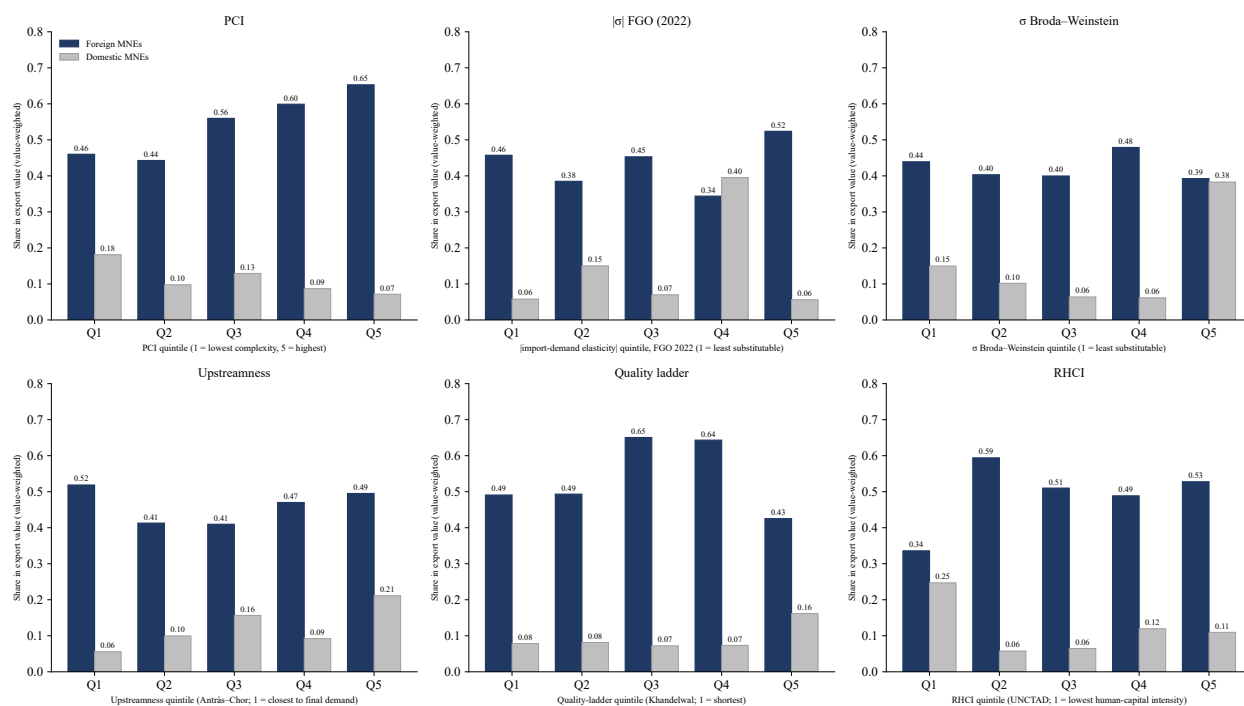

Figure 14: Figure 2 redrawn for six sophistication measures (foreign navy, domestic gray; quintiles over HS6 products).

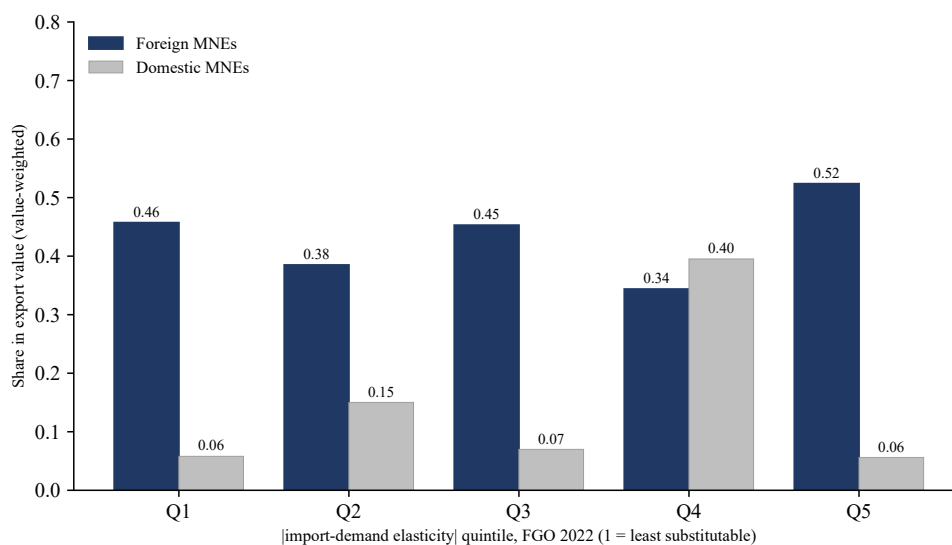

Figure 15: Figure 2 with $|\sigma|$ from Fontagné, Guimbar and Orefice (2022) in place of the PCI.

4 Fact 3 — Multinational corporations from a small set of countries dominate exports

4.1 Original exhibit

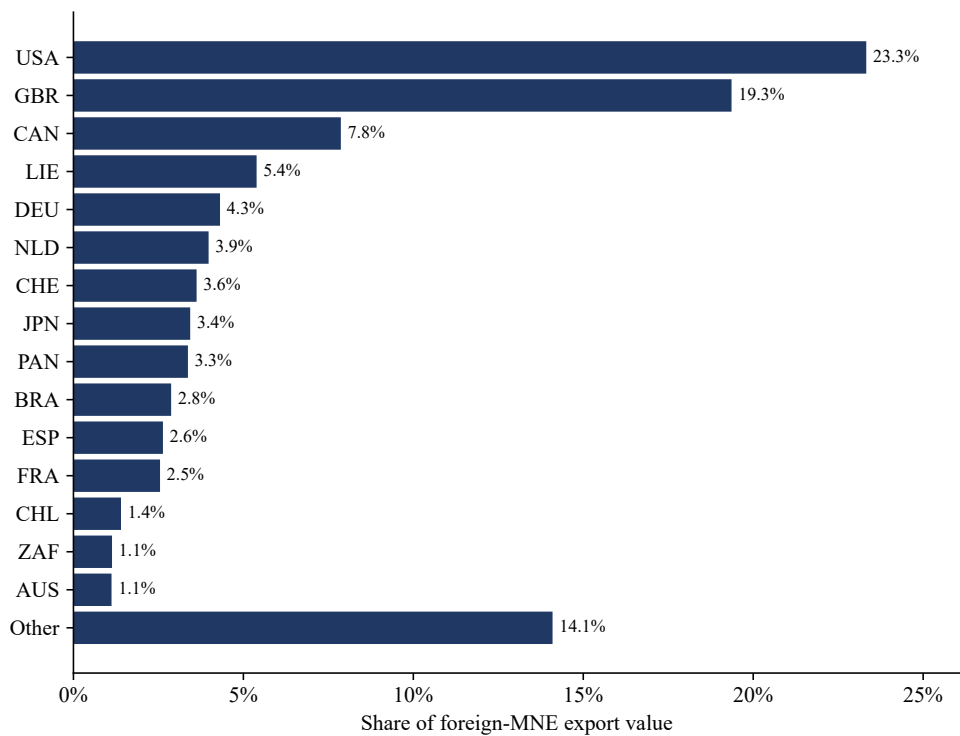

Figure 21: Figure 4 of the note, reproduced on the current base: foreign-MNE export value by parent country, top 15 plus Other.

Note: Foreign MNEs with a recorded parent country (92 % of foreign-MNE value here, against about half in the note). Numbers in Table 6.

Foreign MNEs, parent unknown (excluded above)	–	83.6

4.2 Variant: parent country $\times$ export destination — tables (item 1c)

Rows are the parent's region or country, columns the destination; the three panels give value, row percentages (the destination mix of each parent group) and column percentages (who supplies each destination). Domestic MNEs and local exporters are added as rows for comparison. Only 9.1 % of known-parent foreign-MNE exports go to the parent's own country; European and Panamanian parents in LAC are China-facing commodity platforms, Japanese, German and Dutch parents are Brazil-facing, and only US and Canadian parents ship home in size.

>100	1,099	8.9	560.2	56.0
All parents with a network record	12,371	100	1,000.6	100

Foreign-MNE parents (parent name key) exporting from the nine origins; 98% of parents and 97% of foreign-MNE export value have a matched global-network record (Orbis $\cup$ D&B roster, src/16). Network size = number of distinct worldwide affiliates.

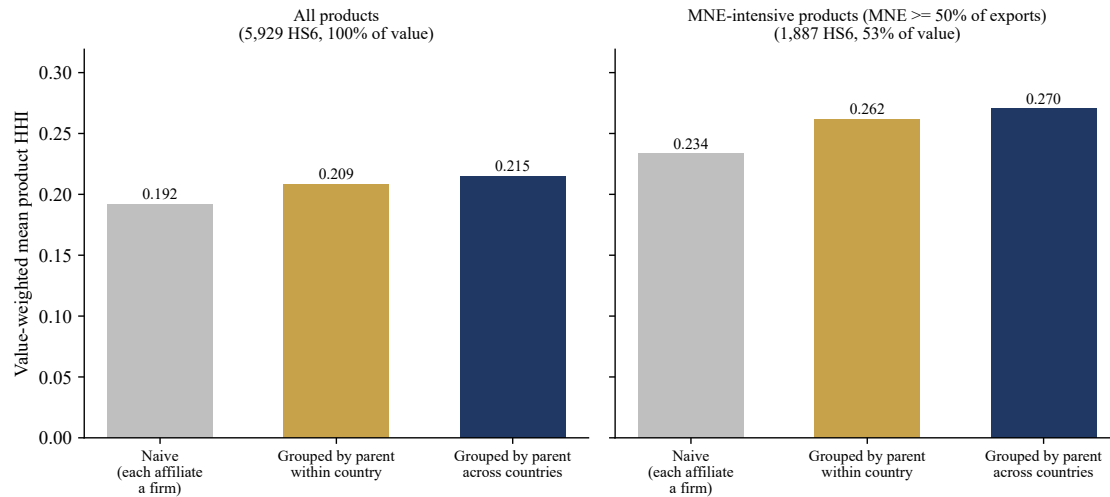

Figure 30: Figure 6 of the note, reproduced: product-level export concentration, naive firm count vs grouping affiliates by parent.

Table 18: Numbers behind Figure 30: HHI, top-exporter share, effective number of exporters

Sample	Measure	Naive	Within country	Across countries

	Mean top-exporter share	31.0%	32.5%	33.7%
	Effective number of exporters (1/HHI)	12.5	11.7	10.4
<i>MNE-intensive products (MNE ≥ 50% of exports): 1,887 HS6, 53% of value</i>				
	Mean HHI	0.234	0.262	0.270
	Mean top-exporter share	36.0%	38.7%	39.8%
	Effective number of exporters (1/HHI)	8.9	8.0	7.4

Value-weighted means across HS6 products (nine origins, Ecuador excluded). Naive: each exporting affiliate (Tax ID) is a firm; then affiliates of the same global parent are grouped within a country and across countries.

5.2 Variant: groups versus affiliates inside the market cells (item 1e, “MNE cantidad”)

Counting multinational *groups* instead of affiliates changes nothing at the origin–destination–product–year grain: a group almost never exports the same product to the same destination through two affiliates (Table 19), so the count regressions of Fact 5 are identical whichever unit is used (Table 20). The grouping matters at the product level (Figure 30), not in the market cells.

Table 19: Affiliates per group in the origin–destination–product–year cells

6.2 Variant: presence through headquarters, through another affiliate, or not present; MNE counts (item 1e)

Of foreign-MNE export value, 8.4 % is shipped to the parent's own country (presence through headquarters), 40.5 % to destinations where the group has another affiliate, and 51.1 % to destinations where the group is not

present (Table 22). Splitting the count of multinationals by presence type (Table 23) shows that the positive association between MNE presence and local exports is strongest for foreign MNEs with *no* presence at the destination and weakest, but still positive, for those shipping to their own headquarters' country.

'Through headquarters': the affiliate ships to its parent's country. 'Through another affiliate': the group has an affiliate in the destination (Orbis/D&B roster) that is not the parent. Pooled 2006–2022. Every matched exporter is itself an affiliate (see the script header), so an 'exporter is the HQ' split is not available in this base.

7.2 Variant: foreign presence through headquarters vs through another affiliate; domestic MNEs (item 1e)

Distance attenuation is essentially the same whether the foreign group is present through its headquarters or through another affiliate, and smaller when it is not present at all; domestic MNEs whose group has an affiliate in the destination show the largest attenuation (Table 29).

9 Agriculture focus and the four-sector version (item 2)

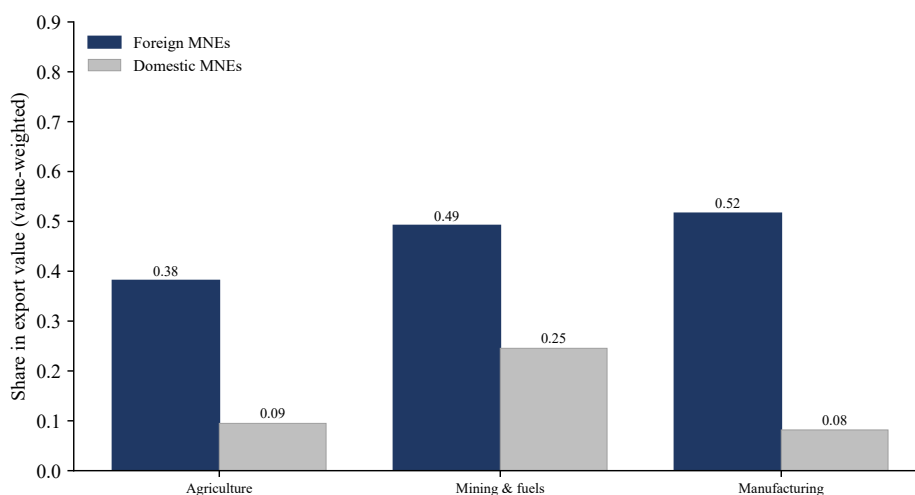

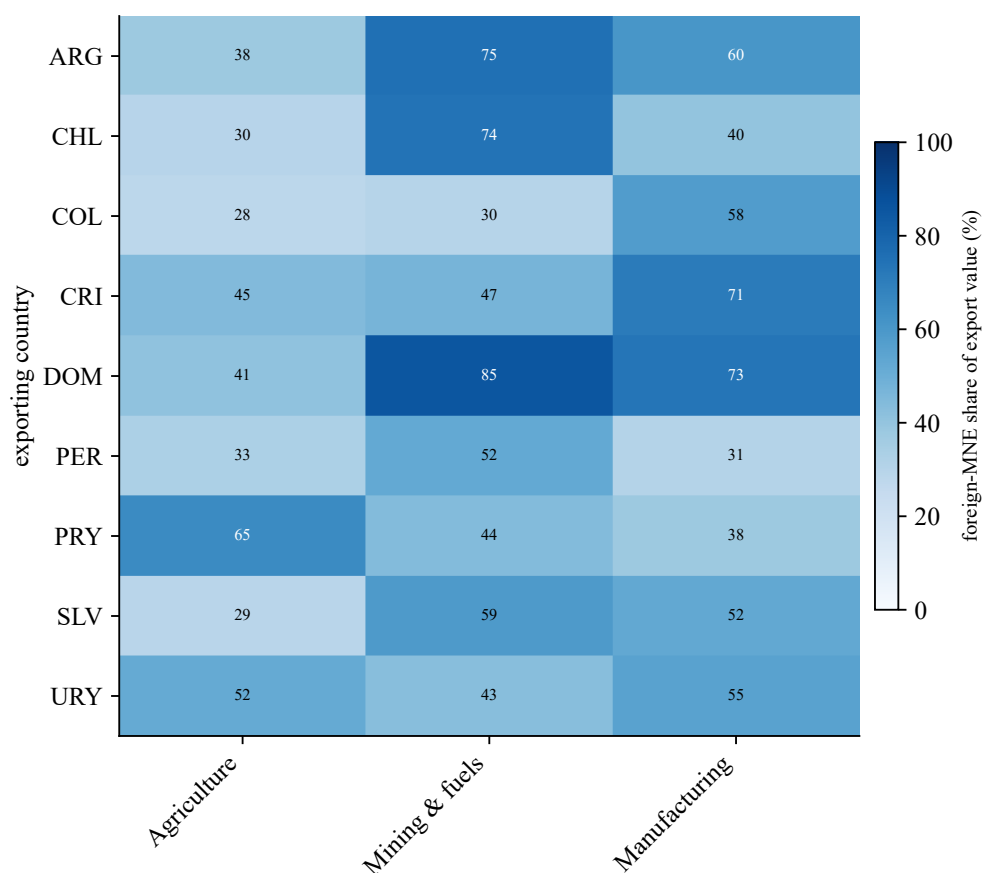

9.1 Four sectors

Agriculture = HS 01–24; mining & fuels = HS 25–27 plus 71 (precious metals and stones); manufacturing = the rest. Services are not observable in customs merchandise data; the memo table reports the only service-related information available (the matched affiliate's own NAICS).

Table 37: The three observable sectors: value, MNE shares, leading parents

Foreign-MNE exports by sector: destination mix (row %); last column = row total, USD bn.

Table 41: Memo: service-sector affiliates among matched exporters (NAICS of the affiliate)

% memo: matched exporters classified in services/trade NAICS (2-digit 42-49, 5x-8x) account for 17.6% of matched export value (254.9 bn of 1,447.8 bn). Customs data record goods only; a services version of the facts would need a different source.

9.2 Agriculture: sub-classifications

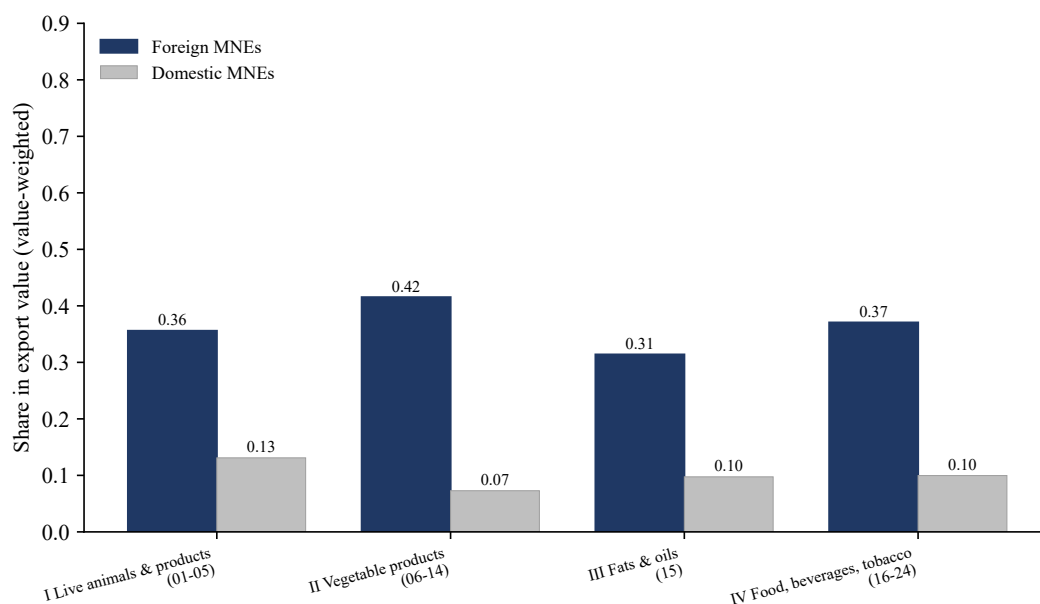

Each split gives the foreign and domestic MNE shares and the leading parents, then an origin $\times$ sub-sector heat map of the foreign share with its two-panel table (Panel A: composition of the origin's agricultural exports, rows sum to 100; Panel B: the foreign-MNE share within each cell, with the origin's overall share in the "All" column). The BEC end-use classification (UNSD HS07→BEC Rev.4) is the "consumption goods vs inputs" cut; the agro-inputs flag isolates fertilisers, agrochemicals, seeds for sowing, animal feed, agricultural machinery and live animals (whole soybeans are output, not seed).
